

**REMARKS**

The drawings, specification, claims and abstract have been amended in a manner believed desired by Examiner Shakeri to overcome the objection to the drawings and disclosure. Favorable reconsideration is respectfully requested.

The present invention solves the problems utilizing a bolt 90 to hold the hollow shaft to the bit receiver of the prior art (see page 1, line 22 to page 2, line 8 of the present application) by utilizing a connector for connecting the wall of the first space of the bit receiver with the periphery of the second section of the hollow shaft. The manner of driving the bit receiver is well known in the art (including through use of drivers 80 of the disclosed prior art). The only requirement is that the driver 24 installed on the hollow handle engages with the teeth of the bit receiver (see page 5, lines 21-24 of the present application), with the particular driver whether in the form of a "protuberance", drivers 80 of the disclosed prior art, or any other driver known in the prior art not being specifically recited in the claims of the present application so that the claims are not limited thereto. Thus, it is respectfully submitted that the rejection under 35 U.S.C. § 112 has been overcome. Favorable reconsideration is respectfully requested.

Favorable consideration on the merits and allowance are respectfully requested.

Respectfully submitted,

Zu-Shung Shu

Dated: December 16, 2005.
